IMCN SEMINAR

" The cosmic origin of biomolecular chirality "

Wednesday 23 February 2021 – 11:00 am
Auditorium SUD11
Croix du Sud, 1348 Louvain-La-Neuve

Dr. Cornelia MEINERT

CNRS, Université Côte d'Azur, Institut de Chimie de Nice

ABSTRACT

'How did life choose its handedness?' Just like our hands mirror each other, but cannot be superimposed on each other, amino acids and sugars exist in left- and right-handed forms. Even if there appears to be no biochemical reason to favor one enantiomer over the other, life on Earth uses almost exclusively *left-handed* amino acids and *right-handed* sugars. This is called biological homochirality and it is inevitable for building functional proteins and RNA/DNA. Numerous experiments have confirmed that simple prebiotic molecules could have been synthesized both in space as well as on the early Earth. However, the preferential selection of one enantiomer over the other remains to date most likely explained by asymmetric interactions of stellar ultraviolet circularly polarized light (UV CPL) with chiral organics. The astrophysical origin of homochirality is strengthened by *i*) the detection of L-enriched amino and D-enriched sugar acids in meteoritic samples, *ii*) the detection of CPL in several star-forming regions as well as *iii*) experiments studying the interaction of UV CPL with prebiotically relevant chiral species. In this talk, I will highlight significant results on our on-going cometary ice simulation experiments (**Fig. 1**) as well as on circular dichroism and anisotropy spectroscopy as a key tool to decipher the response of chiral molecules to UV CPL. Moreover, I will present our major findings on recent asymmetric photosynthesis/photolysis experiments to discuss whether stellar UV CPL could have induced a common chiral bias across molecular families?

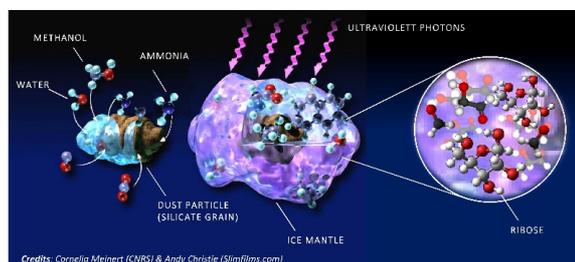

Figure 1: Ribose forms in the icy mantles of interstellar dust grains from simple precursor molecules (water, methanol, and ammonia) under high energy radiation.

Support by the European Research Council under the EU's HORIZON 2020 research & innovation programme [grant agreement 804144] is gratefully acknowledged.

BIOGRAPHY

Cornelia Meinert is a CNRS Research Director at the Université Côte d'Azur, Nice (France). After completing her chemistry studies at the universities of Rostock and Leipzig (Germany), she obtained her PhD on characterizing complex environmental samples with Werner Brack at the Helmholtz-Centre of Environmental Research in Leipzig. In 2013, after 4 years of PosDoc at the University of Nice (France), working on the asymmetric origins of amino acids, she has been nominated a permanent Research Scientist in physical chemistry by the French National Centre for Scientific Research (CNRS). She was awarded the CNRS Bronze Medal in 2018 and an ERC Starting Grant exploring a unified hypothesis of the emergence of biological homochirality (A-LIFE).

Her current research interests focus on the origin of life; mainly on the origin and the detection of chiral molecules in interstellar dust particles, comets, meteorites and on the surface of other planetary bodies. Particularly, the photochemical formation of organic molecules and their evolution in interstellar environments triggered by *circularly polarized photons* are key questions of her work.
